

## Test The Model

Firstly we are slicing the x\_test data until the first four images. In the next step we the printing the predicted output.

### Predicting the output

```
prediction=model.predict(X_test[:4])
print(prediction)
```

```

```

```
import numpy as np
print(np.argmax(prediction,axis=1)) #printing our labels from first 4 images
print(y_test[:4]) #printing the actual labels

 [1. 0. 0. 0. 0. 0. 0. 0. 0. 0.]]
```

As we already predicted the input from the x\_test. According to that by using argmax function here we are printing the labels with high prediction values
